

Vormetric Deepens Security Intelligence with IBM QRadar Integration

Thursday, March 13, 2014 01:00:00 PM (GMT)

New Integration Significantly Reduces Time to Incident Detection and Response to Thwart Cyber Attacks

SAN JOSE, Calif., March 13, 2014 /PRNewswire/ -- Vormetric, the leader in enterprise [data security](#) for physical, virtual and cloud environments, today announced integration with [IBM's QRadar Security Information and Event Management](#) (SIEM), an automated analytics tool for correlating events across entire enterprise environments to identify threats. After recently announcing integration with SIEM solutions [HP ArcSight](#) and [Splunk](#), Vormetric continues to strengthen its data security offerings with integration of IBM QRadar into the Vormetric Data Security Platform

The integration feeds detailed data access information from the Vormetric Data Security platform directly into IBM QRadar, and provides implementation tools as well as pre-built dashboards, reports and displays that enable organizations to get up and running quickly. The resulting combined solution rapidly identifies unauthorized data access attempts – indicating accounts that represent a possible threat – and includes capabilities to monitor and alert on data access patterns that may indicate the presence of an Advanced Persistent Threat (APT) or a malicious insider attack.

[Click to Tweet:](#) #DefenderOfData news: @IBM QRadar integration with @Vormetric delivers advanced #SecurityIntelligence

"Data can't defend itself: it's Vormetric's mission to enable our customers solve data security compliance problems and avoid data breaches across both enterprise and cloud environments. The integration of Vormetric with IBM QRadar delivers the type of advanced security intelligence that every organization needs to safeguard critical data," said Derek Tumalak, VP of Product Management. "By combining our capabilities, organizations can enhance their data protection stance with automated data access pattern analysis, enabling them to identify potential threats to sensitive data at the source."

In addition to "out-of-the-box" security intelligence reports, dashboards and displays, search operations can immediately extract information from the log streams produced by Vormetric Transparent Encryption and the Vormetric Data Security Manager (DSM). A second level of security is included, the capability to "watch the watcher", detecting attacks against not only the data, but also against data security management infrastructure and accounts. Organizations can identify unusual and anomalous accesses patterns by security administrators that may indicate a malicious insider within the security organization, or a security administrative account that has been compromised. ...maybe the visualization element shows up here.

"The final result is a real win for our joint customers," said Derek. "These customers can now easily make use of all the security intelligence data supplied by the Vormetric Data Platform with IBM QRadar, taking their data protection efforts to the next level with detailed views of who, when, where and how critical data is accessed".

About Vormetric

Vormetric (@Vormetric) is the industry leader in data security solutions that span physical, virtual and cloud environments. Vormetric helps over 1300 customers, including 17 of the Fortune 25 and many of the world's most security conscious government organizations, to meet compliance requirements and protect what matters —their sensitive data —from both internal and external threats. The company's scalable solution protects any file, any database and any application — within enterprise data center, cloud, big data environments — with a high performance, market-leading Vormetric Data Security Platform that incorporates application transparent encryption, access controls and security intelligence. Vormetric — because data can't defend itself.

About IBM Security

IBM's security portfolio provides the security intelligence to help organizations holistically protect their

people, data, applications and infrastructure. IBM offers solutions for identity and access management, security information and event management, database security, application development, risk management, endpoint management, next-generation intrusion protection and more. IBM operates one of the world's broadest security research and development, and delivery organizations. IBM monitors 15 billion security events per day in more than 130 countries and holds more than 3,000 security patents. For more information on IBM security, please visit: www.ibm.com/security.
